

Share from SharePoint without sending people into SharePoint.

A branded front door on the SharePoint content you already manage. Clients, partners and occasional users see only what concerns them. Files stay where they are, under the permissions and controls you already have.

Sharing through SharePoint works until someone outside your team has to use it.

SharePoint is built for people who are in it every day. Clients, partners and occasional users aren't, and it shows.

They land in your intranet

Open a shared link and a guest gets the app bar, the ribbon, Site contents and the Recycle bin. Nobody has shown them where to look, so they email you and ask.

One site per client doesn't scale

Every new client or project means another site, another set of permissions and another address to send. Someone working with you on three things has three places to look.

Links pile up

Documents go out one link at a time. A few months in, a client has a dozen URLs spread across their inbox, some expired, some returning "access denied", and your team is fielding the requests.

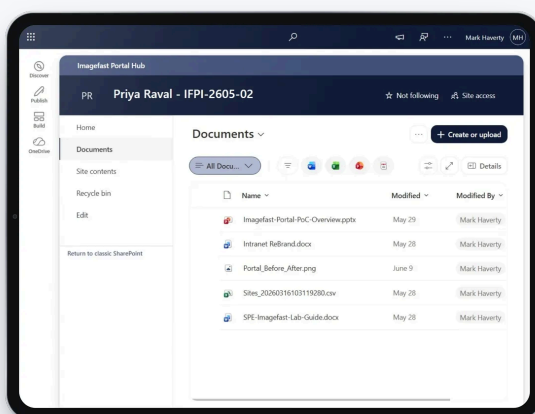

Nothing says it's yours

No welcome page, no status, nothing about the relationship. It looks like a file share, because that is what it is.

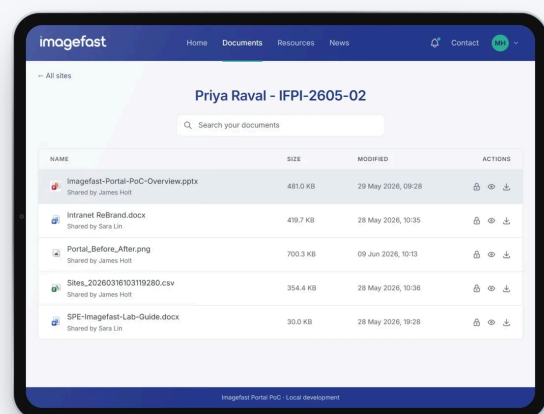

So people go around it.

When sharing is awkward or locked down, documents leave as email attachments or through consumer file-transfer sites — outside the retention, data loss prevention and audit you already pay for in Microsoft 365.

What a guest sees in SharePoint today

The same files in Imagefast Portal

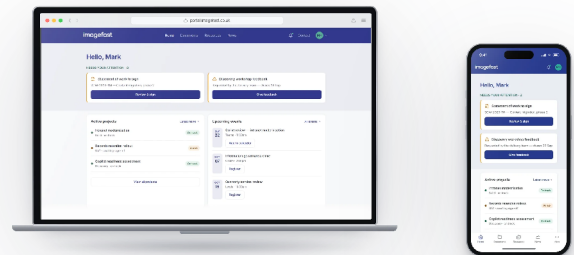

The same SharePoint library, the same permissions. Only the front end is different.

Your portal, your brand, nothing changed underneath.

The portal changes what people see and how they reach it. It does not change where anything lives.

- **Your brand and wording**
Logo, colours, language and page layout, set by you during the build.
- **Pages you choose**
What appears, in what order, and for whom.
- **Search that finds the document**
Results open where they are. No sites to navigate, no folders to guess at.
- **Any device, nothing to install**
Runs in the browser people already have, on laptop, tablet and phone.
- **Room to grow**
Add pages and sources later without rebuilding what is there.

Only the experience changes. Same files, same permissions, same SharePoint underneath.

Bring your other systems into the same place.

In the base build

Content drawn live from the SharePoint sites you choose, branded and searchable.

With the connector add-on

Status, actions, submissions and reports from the systems you already run, alongside the documents.

Dynamics 365 and CRM

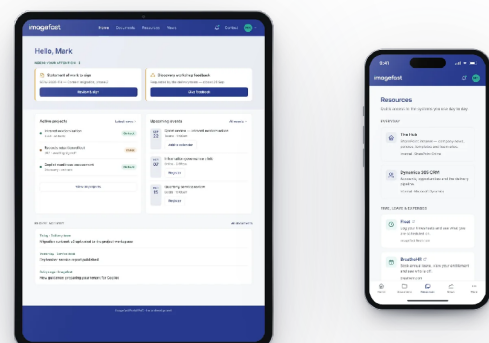

Line-of-business apps

Power BI reporting

Dataverse and SQL

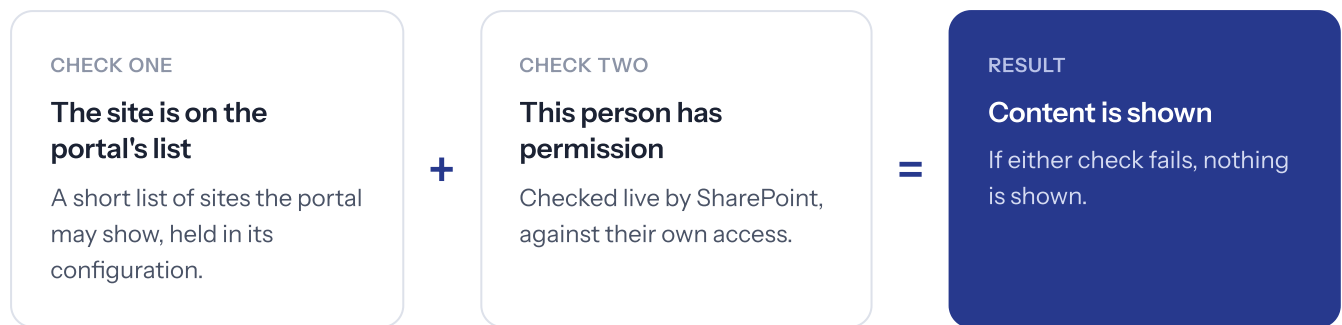

Forms and submissions

Any REST or Graph API

Your controls still apply. SharePoint still decides who sees what.

Two checks, both of which must pass. The portal keeps no access list of its own.

No second list to drift

Access lives in SharePoint only, so there is nothing to fall out of step with it.

Microsoft 365 compliance keeps working

Retention and sensitivity labels, data loss prevention, eDiscovery and Purview audit apply exactly as they do now.

Identity is unchanged

People sign in with existing Microsoft Entra accounts, internal or guest, under the MFA and Conditional Access you already apply.

The portal controls what someone is shown, not what they are entitled to. Anyone with SharePoint permission and a direct link can still reach SharePoint itself, so your permissions remain the thing to get right.

One portal, whoever needs a way in.

The same build works for people outside your organisation and for your own staff who only visit now and then.

Clients and customers

A private, branded place for their documents, updates and anything waiting on them, instead of a trail of links.

Client extranets, deal rooms, account portals

Partners and suppliers

Share what each organisation needs to see, from the same SharePoint you use internally, without opening up the rest.

Brokers, agents, contractors, suppliers

Your own occasional users

People with a Microsoft 365 account who don't live in SharePoint and just need to find the thing they came for.

Board members, field staff, part-time teams

The usual ways round it, and what each one costs.

Approach	What the person sees	Where your documents live	What it costs you
Share from SharePoint as it is	The full SharePoint interface, built for daily users	In your Microsoft 365	Support calls, access requests, and staff working around it
Customise SharePoint in-house	A themed site, with much of the SharePoint interface still there	In your Microsoft 365	Specialist time your team is taken off other work for, and upkeep as Microsoft changes the platform
Third-party client portal	The vendor's portal	Copied into another vendor's system	Another subscription, another security review, and keeping two copies in step
Bespoke portal build	Whatever you specify	Often duplicated into a new store	Months of build and ongoing development
Imagefast Portal	A branded portal showing only what concerns them	Where they are now, in SharePoint	A fixed-price build, supported by the team that built it

Built and supported by Imagefast, a Microsoft partner with 25 years of SharePoint, Microsoft 365 and document management delivery.

1,250+ projects for 200+ organisations, from regulated financial services and insurance to energy and utilities, the public sector and professional services.

Questions we are usually asked.

Is anything installed into SharePoint?

No. The portal sits alongside SharePoint and reads from it. Nothing is installed into your sites and nothing inside them changes.

What accounts do external people use?

Existing Microsoft Entra accounts, guest or member. The portal is not an identity provider, so your MFA and Conditional Access carry over. We confirm licensing against your own tenant before quoting.

What if someone already has a direct SharePoint link?

It still works. The portal changes what people are shown, not what they are entitled to, so SharePoint permissions remain the control.

Give people one place to find everything you share with them.

Fewer access requests, fewer links to resend, and a sharing experience that looks like your organisation instead of someone else's software.

See it working in 45 minutes

1

A live portal, not slides

We show you the working product and answer your team's questions as they come up.

2

Your sites, your brand

We talk through the SharePoint sites in scope, how you want it to look, and anything you would want it to connect to.

3

A fixed-price quotation

Sent afterwards, with no paid discovery phase to work through first.
